COMBINING AND VISUALIZING PURCHASE INVOICE DATA

G18

PROJ-A2024-G18-FINAL_PRESENTATION

TOPIC

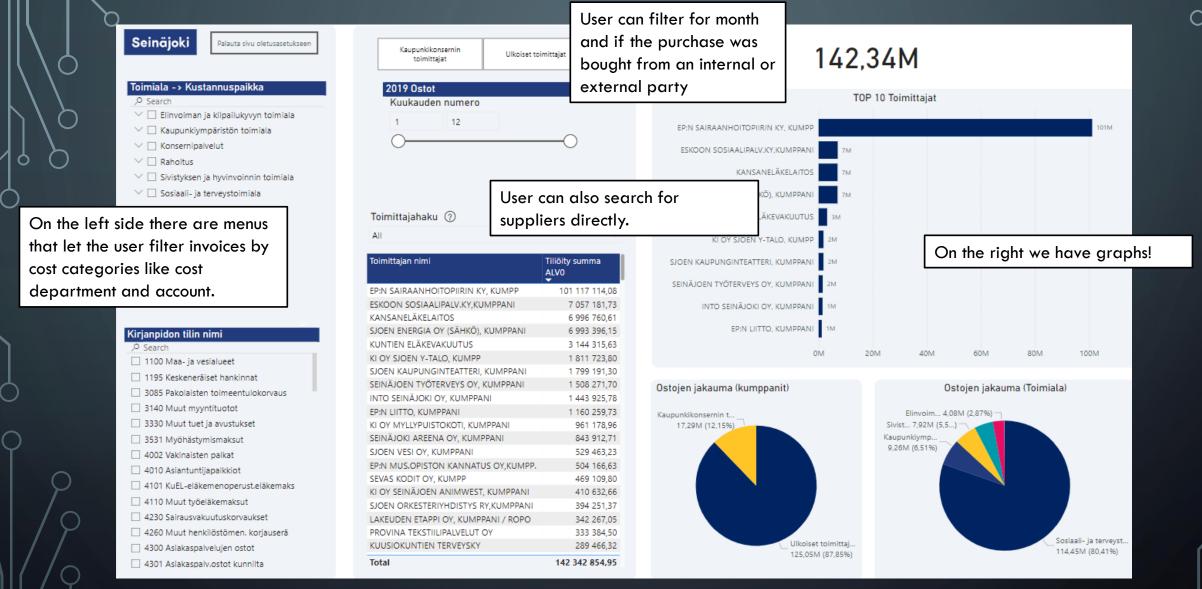

- City of Seinäjoki wanted to visualize invoice data with two different visualized reports.
- Microsoft Power Bl is the customer's chosen visualization tool.
- Some of the data needed correction.
- City of Seinäjoki had multiple data tables that need to be combined and linked together for visualization.

THE VISUALIZED REPORTS

- We made two different Power Bl reports.
- First report visualizes the details of purchase invoices.
- Second report opens up and visualizes purchase invoice handling and process.
- Both reports include different types of graphs to visualize the information.
- Custom DAX queries were created to form different meters and colums that give valuable and meaningful information.
- DAX is the only form of implementable code in the reports.

REPORT 1

• Report 1 visualizes invoice data (of each year) of City of Seinäjoki and makes it easily searchable.

REPORT 2

- Report 2 is an internal SharePoint tool that tracks the handling of invoices
- Year based visualization
- Main view contains measures of the process of invoice handling (length of processing, delays in payment, number of actions etc.)
- 2 views for browsing details
- 2 views for graphs
